## The Problem

## transfemoral prosthesis

| Amputation level | Energy above healthy <br> subject [\%] | Speed [m/min] |
| :--- | :---: | :---: |
| Long transtibial | 10 | 70 |
| Average transtibial | 25 | 60 |
| Short transtibial | 40 | 50 |
| Bilateral transtibial | 41 | 50 |
| Transfemoral | $\underline{65}$ | 40 |
| Wheelchair | $0-8$ | 70 |

Total Knee 2100 - Ossur

## THE CLASSIFICATION

## transfemoral prosthesis - passive

$3 R 95$ - Otto Bock

$3 R 80$ - Otto Bock

## The Classification

 transfemoral prosthesis

C-Leg \& C-Leg compact - Otto Bock

Rheo Knee - Ossur

Smart Adaptive - Endolite

# The Classification <br> transfemoral prosthesis 

Power Knee - Ossur

UNIVERSITEIT TWENTE

## The Classification

## transfemoral prosthesis

| Passive | MP Controlled | Powered |
| :--- | :--- | :--- |
| - No speed adaptation | + Adaptive walking | + Adaptive walking |
| - No push off | - No push off | + Push off support |
| - High metabolic cost | - High metabolic cost | + Reduced metabolic cost |
| + No battery | Requires batteries | - Big batteries |
| + Low price | Medium price | - High price |

## PROPOSED CONCEPT

in theory walking is almost energy free...

$$
\mathrm{A}_{1}+\mathrm{A}_{2}
$$

$\sim 0.20 \mathrm{~J} / \mathrm{kg}$

$\mathrm{A}_{3}$
$\sim 0.13 \mathrm{~J} / \mathrm{kg}$
G
$\sim 0.35 \mathrm{~J} / \mathrm{kg}$

## PROPOSED CONCEPT

## in theory walking is almost energy free...

to design an actuation system;

- that is able to store (power absorption) and release the energy
(power generation)
- that provides energy exchange between the knee and ankle joints.

The actuation system is to be controlled without dissipation (brakes) and will make use of every joule of energy during walking cycle (energy efficient).

## WORKING PRINCIPLE

## bi-directional element

After pre-swing phase, the attachment point of the spring is changed from the heel $\left(P_{1}\right)$ to the upper part of the foot $\left(P_{2}\right)$ (left).
At the end of the swing, the spring is loaded and its position changes back to the $P_{1}$ (right).

## WORKING PRINCIPLE

## ankle elastic element

At the beginning of the stance phase, both elements $\mathrm{C}_{2}$ and $\mathrm{C}_{3}$ are ready for the storage of absorption $\mathrm{A}_{3}$ (left).
At the end of the stance phase, both springs are loaded (right).

## SIMULATIONS

## power flow for each joint

64\% overall system efficiency

GGW

## The Realization

Energy is stored, exchanged and released

Gtw

## TESTS

## TESTS

## RESULTS

joint angles

## RESULTS

joint power

Almost all of $\mathrm{A}_{2}$ portion is stored
$50 \%$ of push-off is provided

## PROPOSED CONCEPT - II

in theory walking is almost energy free...

$$
\mathrm{A}_{1}+\mathrm{A}_{2}
$$

$\sim 0.20 \mathrm{~J} / \mathrm{kg}$

$\mathrm{A}_{3}$
$\sim 0.13 \mathrm{~J} / \mathrm{kg}$
G
$\sim 0.35 \mathrm{~J} / \mathrm{kg}$

## WORKING PRINCIPLE

linkage element

## WORKING PRINCIPLE

 progressive element

## SIMULATIONS

## power flow for each joint

$76 \%$ overall system efficiency

## The Realization

Energy is stored, exchanged and released

TESTS

## healthy subjects

UNIVERSITEIT TWENTE.

TESTS

## ReSULTS

joint angles

Gaw
UNIVERSITEIT TWENTE. ${ }_{25}$

## RESULTS

## ground reaction forces

symmetric ground reaction force behavior

## RESULTS

## joint power

Significant ankle push-off generation
